

Analysis group meeting

Mathieu Ouillon (Mississippi State University)

10 March, 2025

MISSISSIPPI STATE
UNIVERSITY™

One photon from data, one from another event.

The scaling factor:

$$F = \frac{\int_{0.19}^1 \text{data } dM_{\gamma\gamma}}{\int_{0.19}^1 \text{mix } dM_{\gamma\gamma}}$$

Integral between 0.19 and 1 of the data / Integral between 0.19 and 1 of the mixed events.

- Bin over 5 variables: p_T , x_B , ν , Q^2 , z_h
- Similar to the one used by Daniel
- 6 bins with constant spacing for each:
 - ν from 2 to 10 GeV
 - x_B from 0.05 to 0.75
 - p_T from 0 to 2 GeV/c
 - Q^2 from 1 to 10 GeV²
 - z_h from 0.3 to 0.7

I have work on my presentation for GHP

I have also discussed with Whitney the issues he faces in the ALERT reconstruction (the function that generates all the track candidates takes too much time). I know how to fix it, and he gave me some comments about how to write the code.

Noemie want to discuss about the fact that ALERT group have two cooking chef
